## Certificate

This is to certify that:

Name - Rohit Chandrakant Sulakhe

Roll no. – MC2021108

of Master of Computer Application (MCA) as undertaken & completed the Mini project work titled “**Food Delivery App**” during the academic year 2021-22 .

Submitted to this college in partial fulfilment of the curriculum of Master of Computer Application, University of Mumbai.

# Project Description

Online food ordering and delivery is the process in which order for the food is placed through internet and delivered to the customer to the specified place. Food delivery Apps, online food ordering systems is basically designed for those People that don't have time to go to restaurant. As the say, money is not money but time is money.

This app (Fast Food) impressively simplify the ordering process for both customers and restaurants owner, this is the main advantage of online food ordering or delivery system. In past, manual food ordering system was used in which customers have to go to the restaurant and waiter takes order from the customer and writes down in the paper. In this system each and every type of record is stored on the paper. Then the waiter sends the order to the kitchen for the further processing.

Then Personal Digital Assistant technology was used. Personal digital assistant is a portable device like smartphone every waiter should have the PDA and take order form customers. To cover the limitation of PDA multi touch technology come to market, where the user has the authority to perform and control different type of operations at a time on multi touch screen. To cover the limitation of all the previous food ordering systems, mobile food ordering system is developed. This app automates all food ordering process.

The online food delivery application is impressively good for those people that don't have time to go the restaurant. Anyone who have smart phone they can easily order for the food from anywhere and they can receive food at her/her home. Payment can be either online or Cash on delivery.

# Purpose of the Project

With the improvement of technology, online food ordering systems are becoming a popular topic. That's because they are serving the ever increasing demand for convince. The main purpose of app is to provide customers for a way to place an order at a restaurant over the internet.

So why is this important?

The main reason is that it benefits both the customer and the business.

With a website or mobile app, customers can easily browse all the dishes the restaurant has available, customize dishes to their requirements and place an order. It can also save their favourite orders allowing them to easily re-order that in the future.

From the restaurants perspective, they no longer spend time taking the customer's order, stop worrying about communication errors and streamline their order management workflow.

# Technology Used

The project I have selected is UI based, so the technology used here is a UI/UX tool called Figma. Figma is a vector graphics editor and prototyping tool which is primarily web-based, with additional offline features enabled by desktop applications for macOS and Windows. The Figma Mirror companion apps for Android and iOS allow viewing Figma prototypes in real-time on mobile devices. The feature set of Figma focuses on use in user interface and user experience design, with an emphasis on real-time collaboration. For this project I have designed and visualized the UI by creating various screens that a user will experience. This UI/UX will set the stage for the software developers to conceptual the working of the application and decide what technologies to be used for developing such an application like:

- Which programming language should be used?
- In which software should the App be developed in such as Android Studio?
- Types of Database to be implemented?
- How to integrate this UI design into a working App?

# FOOD DELIVERY APP FEATURES

## ❖ Customer's perspective

### 1. Simple registration

The registration process is the first step to build a long-lasting relationship with the customer. They can either create a new account using the email address, login via Facebook or Google account.

### 2. Placing an order

Order screen should definitely include the summary covering every important order detail: chosen dishes, their quantity, final price, delivery details and add a note option.

### 3. Various payment options

The app include in-app payment and cash options. It has all the development requirements concerning security, support secure and fast experience. The system of bonuses and coupons is also taken into account while calculating the final cost.

### 4. Delivery time estimation

Determining the delivery time will help to manage Customer's expectations and decrease delay complaints.

### 5. Order tracker

Customers prefer to stay informed about their takeaway. With the help of simple notifications like approved, cooking, picked, delivering and completed, they can stay in touch and track the whole order process.

## **6. Reviews and rates**

It greatly helps to optimize the client experience and brand your product. Improving rates considerably affects sales. So it is made sure to encourage the customers' reviews by asking for service feedback.

## **7. Attractive design**

Food delivery application development covers great UI design that has to focus on the unified look. This category of applications includes lists of services and catalogs of restaurants and meals.

## **8. The great search engine**

Customers will not waste time on seamless searching. I have included several options including restaurant names, location, cuisines or specific meals. Great UX design predicts the customers' moves in advance and is ready to maintain this experience. I have made sure to design a delivery system that is ready to guide Customer through every need.

### **❖ Restaurants' perspective**

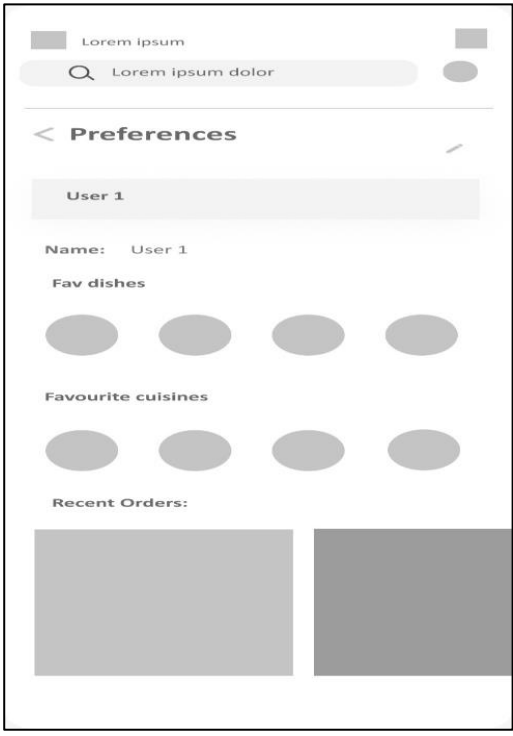

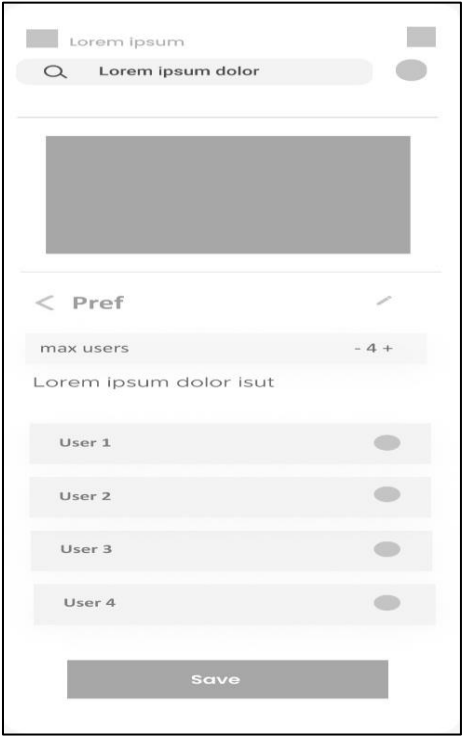

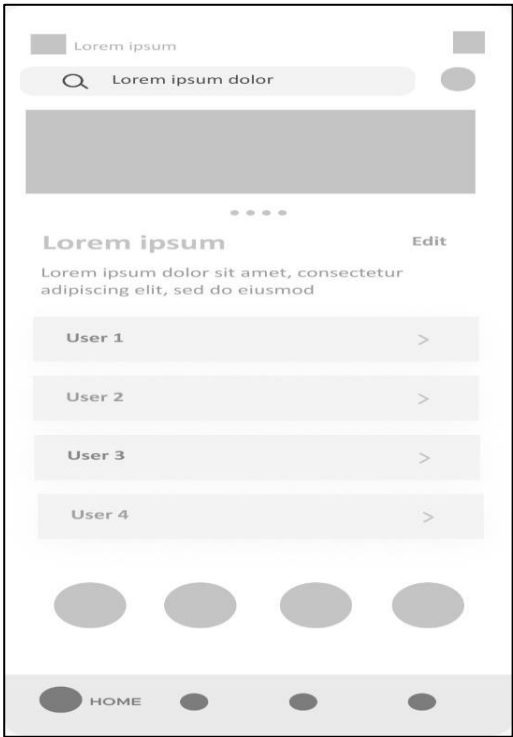

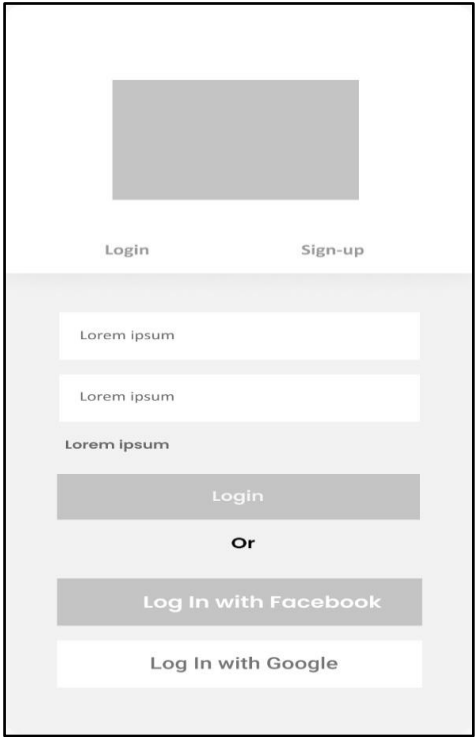

1. Registration
2. Content management
3. Order management
4. Restaurant Management Dashboard

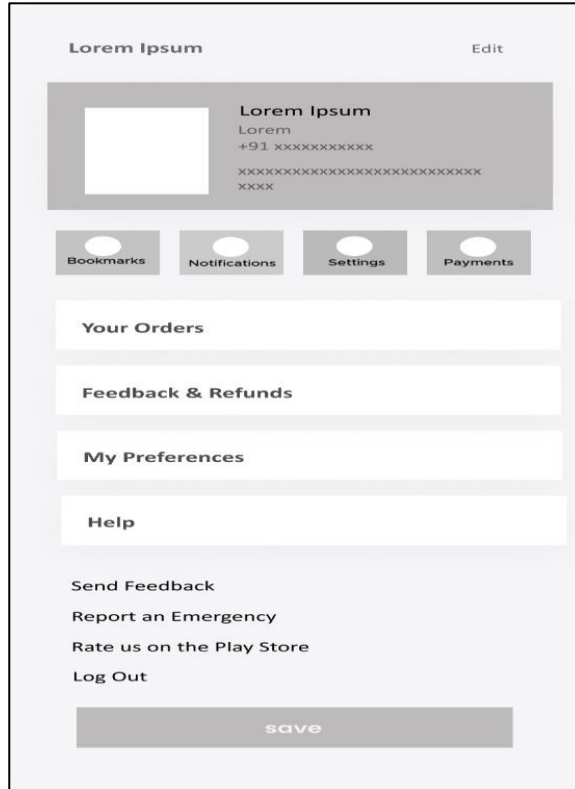

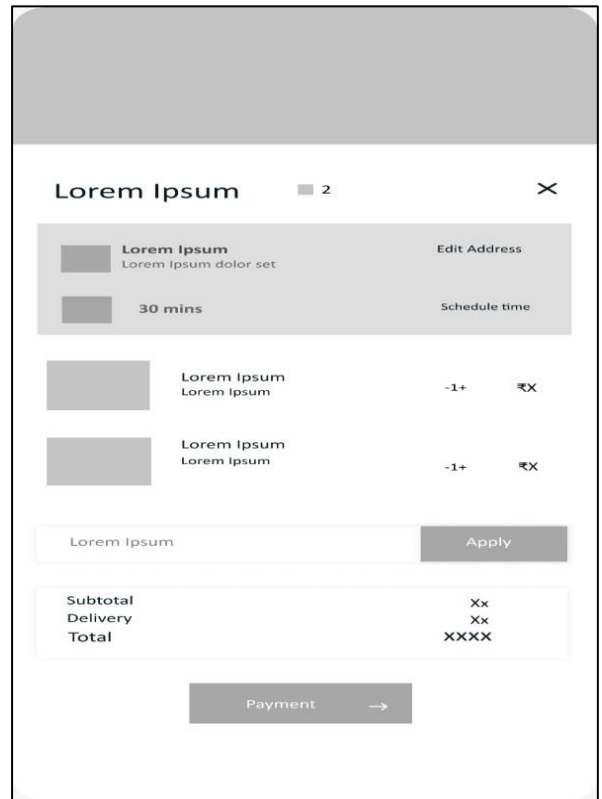

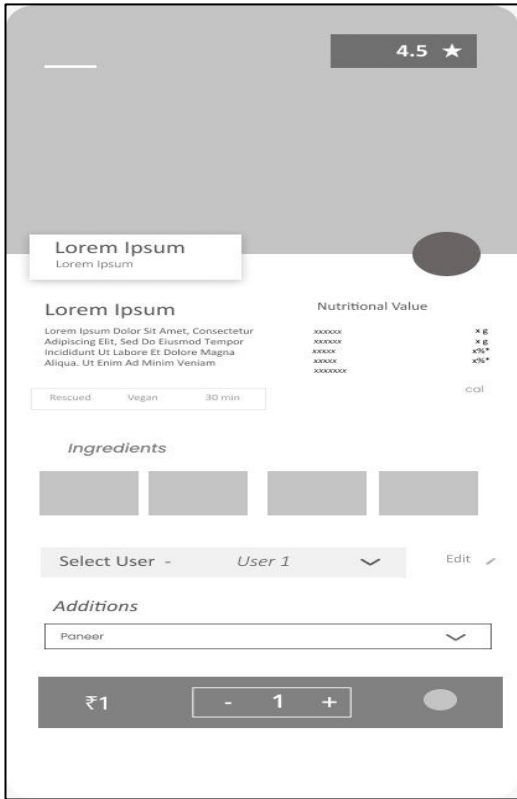

### **❖ Delivery Person's perspective**

1. Registration
2. Order management
3. Delivery status update

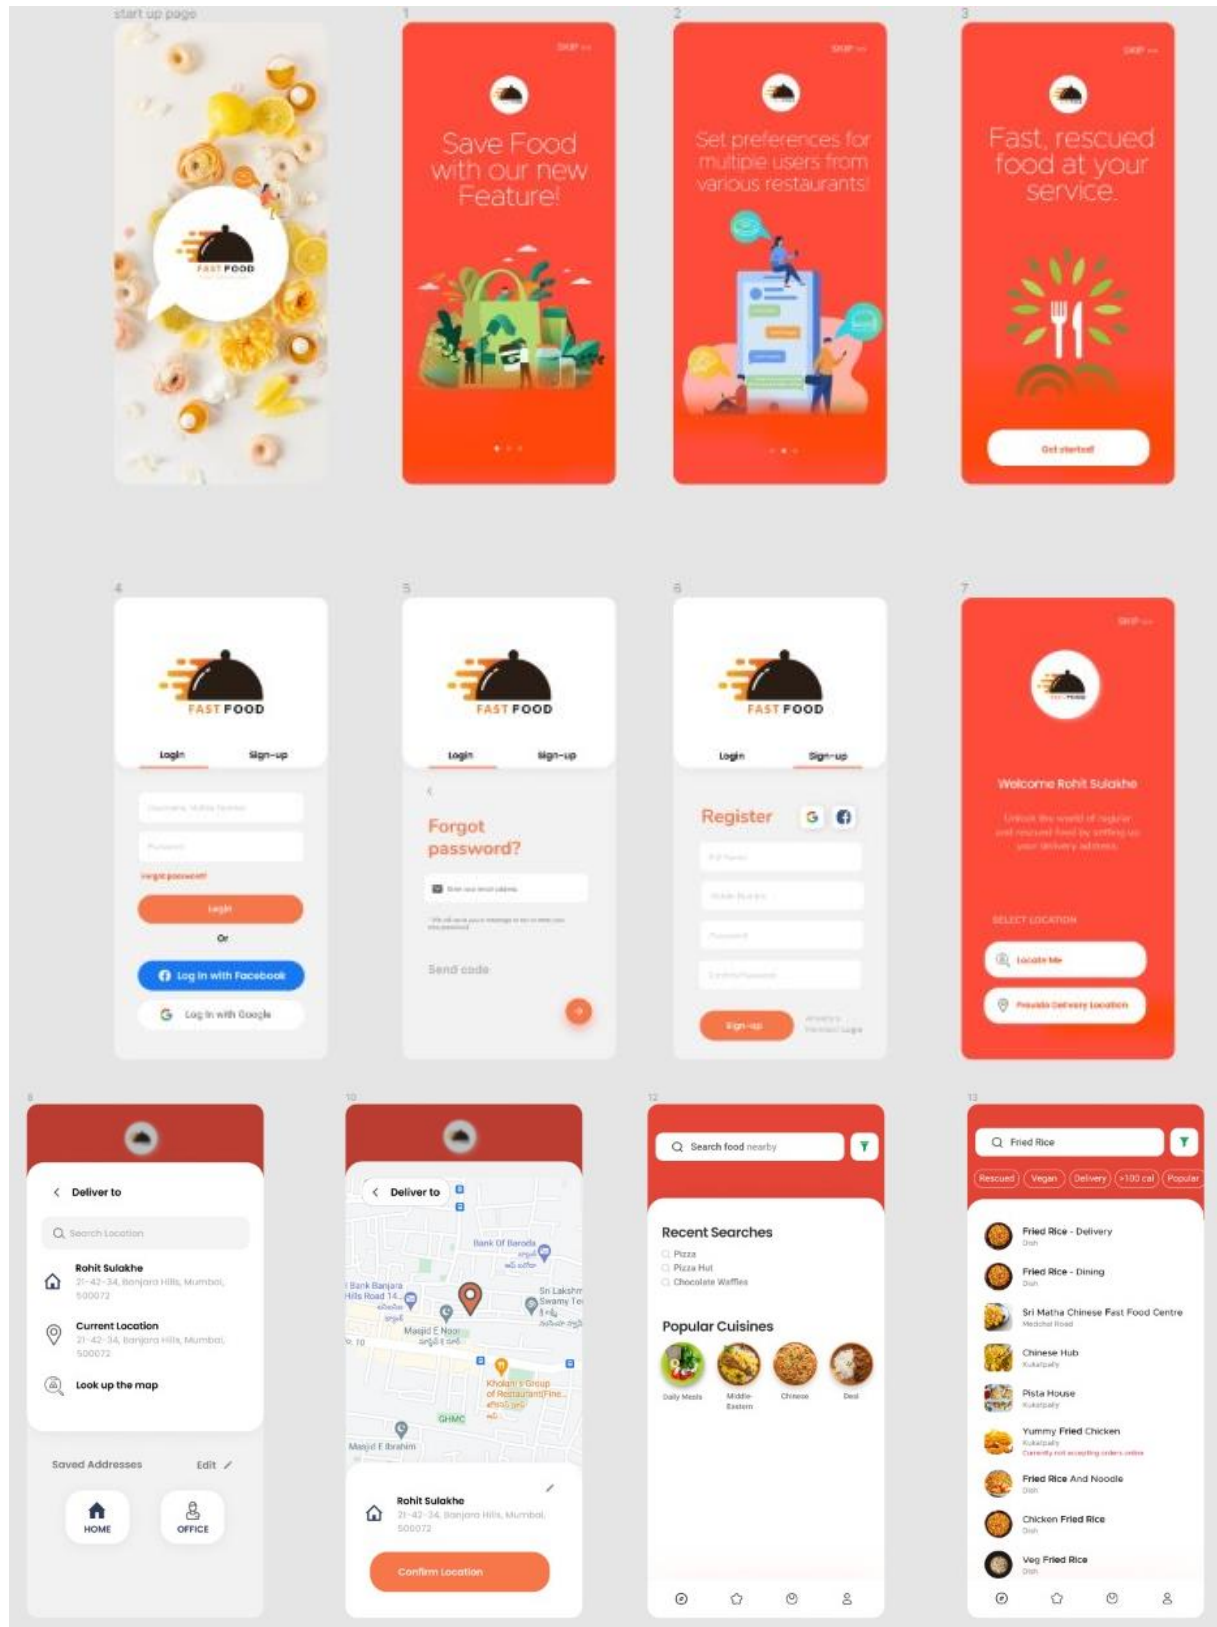

# Coding-Wireframe

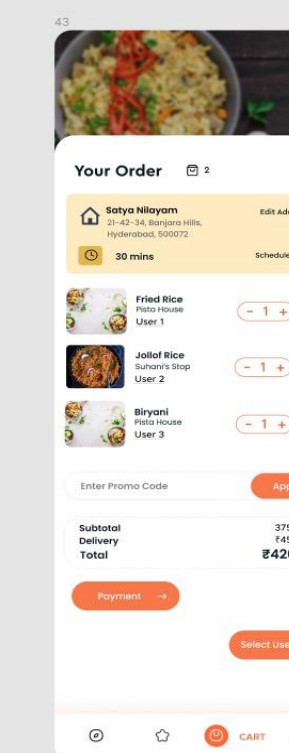

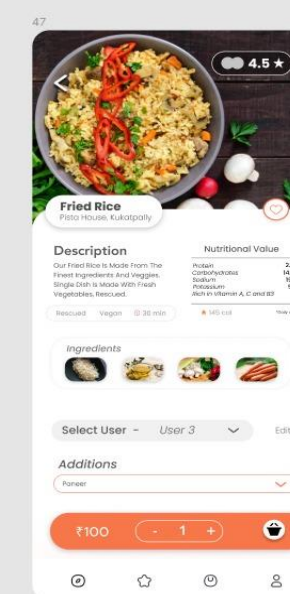

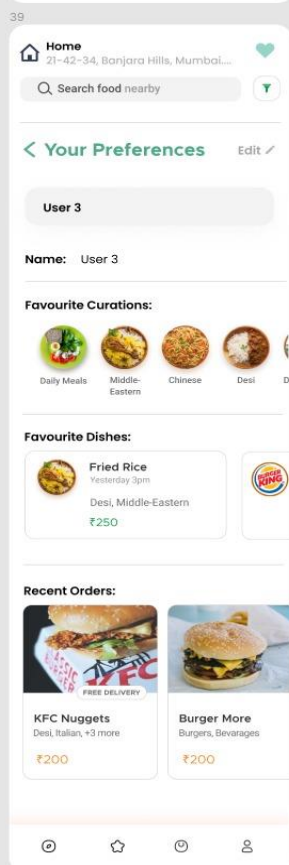

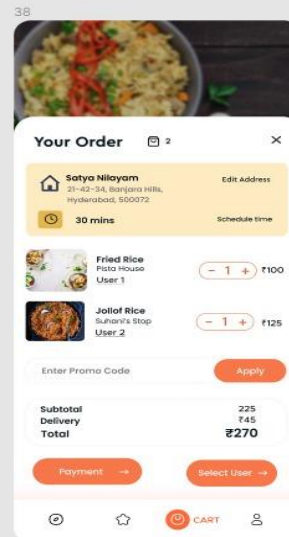

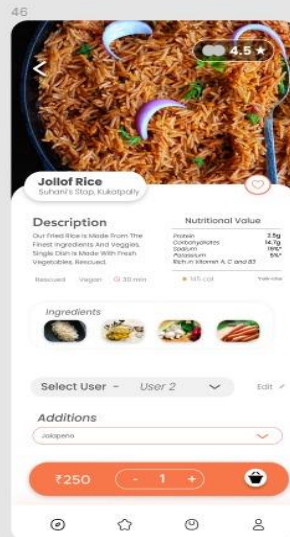

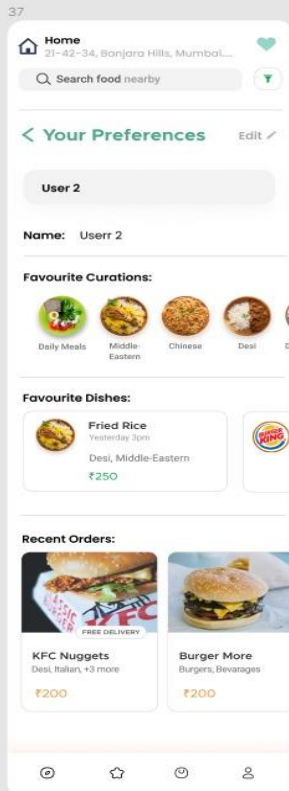

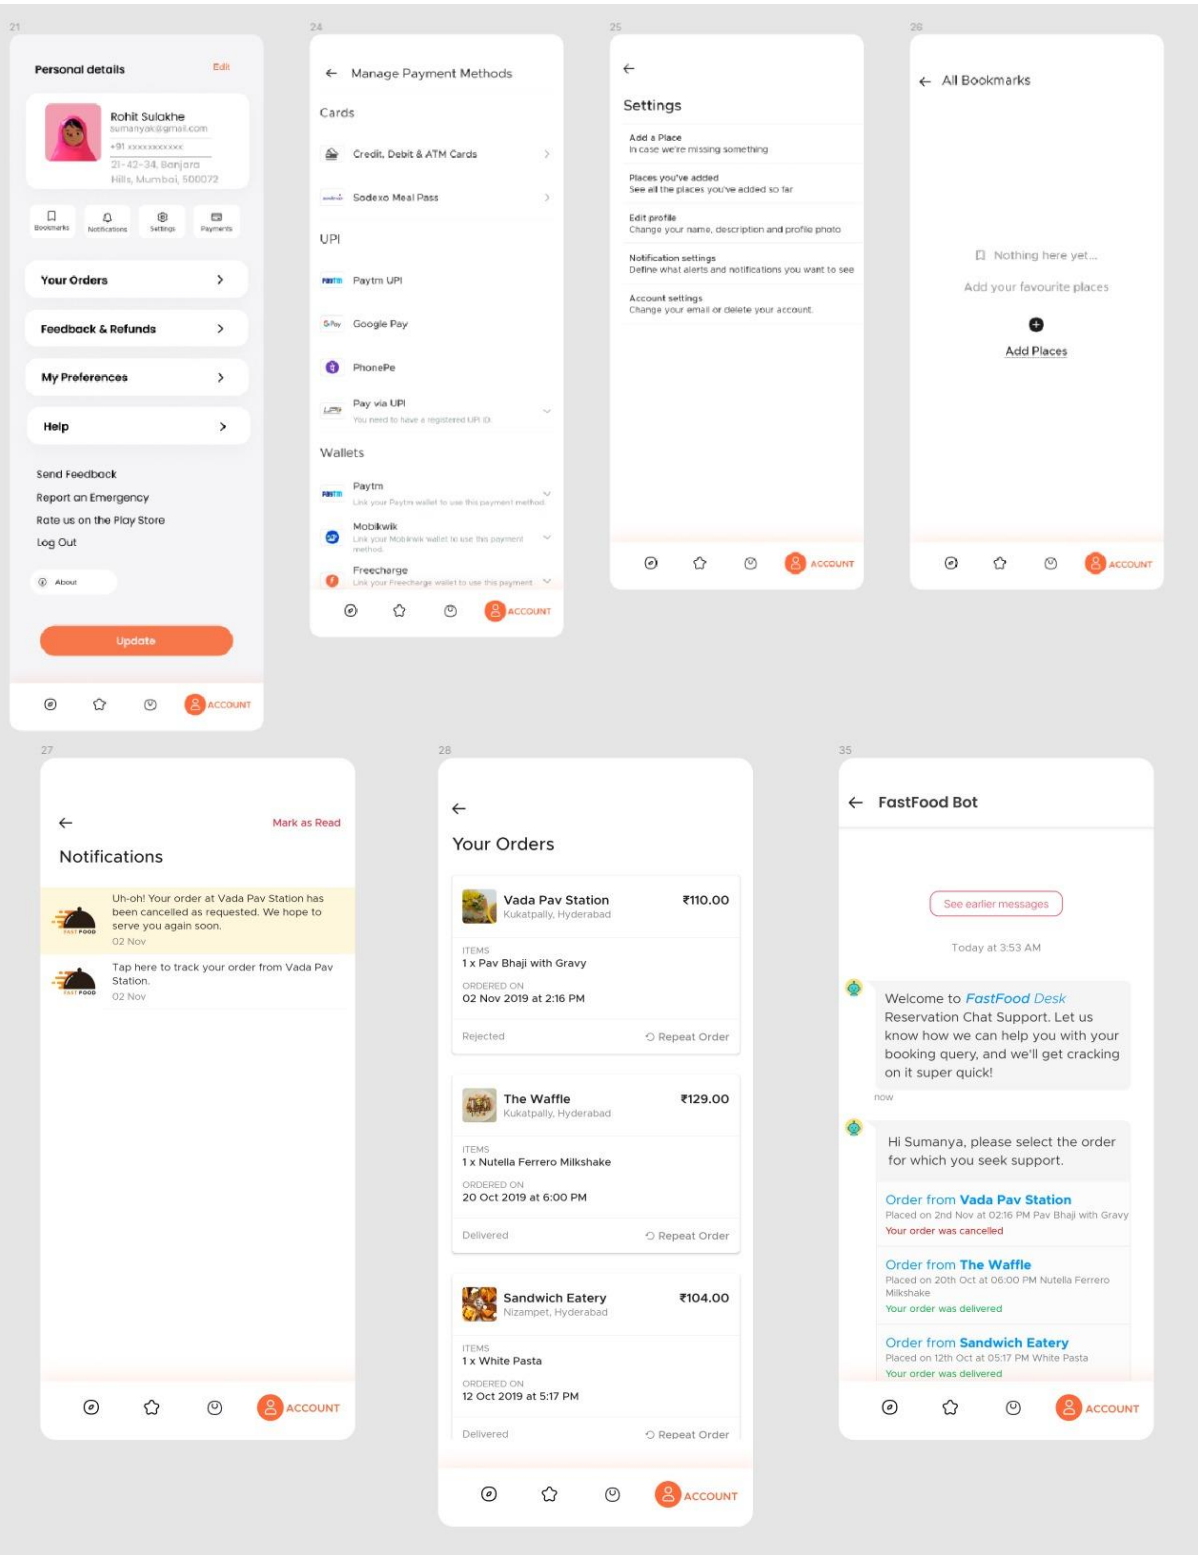

# OUTPUT

# Conclusion

Overall, working on the app design was a great challenge and experience. I got to work end-to-end, starting from designing a UI Kit, to understanding business problems, and trying multiple ways to help users discover and transact within the app. This project can later be expanded on a larger scale. It is developed for restaurants to simplify their routine managerial and operational task and to improve the dining experience of the Customer's as well. This also helps the restaurant owners develop healthy customer relationships by providing reasonably good services.
